Graphing Reciprocal functions:
(1). Asymptotes - are lines that we sketch in to help us find the shape of the

- They are NOT part of the graph which is why we always make them dotted
- The curve will approach an asymptote but never touch or cross it.
*     - Draw in the asymptote (s) first! They occur wherever the original function crosses the $x$-axis $(y=0)$

The reciprocal $f$ :

$$
y=\frac{1}{x+1} \Rightarrow x \neq-1
$$

$$
\begin{array}{rl}
y=(x+3)(x-5) \Rightarrow y & =\frac{1}{(x+3)(x-5)} \\
x & x-3,5 \\
& \text { asymptotes. }
\end{array}
$$

- Put on any Invariant points (a point on the original curve AND the reciprocal), or when $y=1$ or -1
* Plot enough points to get the shape of the curve by FLIPPING the $y$-value.

$$
\begin{aligned}
& \left.\begin{array}{l}
\text { ORIG } \\
(1,7)
\end{array}\right) \frac{\text { REIPROCAL }}{(1,1 / 7)} \\
& (3,100) \longrightarrow(3,1 / 100) \\
& \underbrace{}_{\text {Big \#'s become tiny }} \\
& \left(7, \frac{1}{1000}\right) \longrightarrow(7,1000) \\
& \underbrace{}_{\text {Tiny \#'s become big! }} \longrightarrow(
\end{aligned}
$$
