

Solving Quadratic Equations using Completing the Square.

$$\underline{\underline{(x^2 + 10x)}} + 4 = 0$$

① Complete the square.

$$(x^2 + 10x + 25) - 25 + 4 = 0$$

$$\boxed{(x+5)^2} - 21 = 0$$

+21 +21

② Isolate the bracket

$$\sqrt{\underline{\underline{(x+5)^2}}} = \sqrt{21}$$

$$\begin{matrix} x+5 \\ -5 \end{matrix} = \begin{matrix} \pm \sqrt{21} \\ -5 \end{matrix}$$

(means $+\sqrt{21}$ or $-\sqrt{21}$)

$$x = -5 \pm \sqrt{21}$$

$$= -5 + \sqrt{21}$$

$$\text{or } = -5 - \sqrt{21}$$

Solve by Completing the Square

$$(1) \quad x^2 - 8x + 13 = 0 \quad x = 4 \pm \sqrt{3}$$

$$(2) \quad 3x^2 + 6x + 1 = 0 \quad x = -1 \pm \sqrt{\frac{3}{2}}$$

$$(3) \quad -2x^2 + 4x + 3 = 0 \\ x = 1 \pm \sqrt{\frac{5}{2}}$$

What about...

$$\sqrt{(x-3)^2} = \sqrt{4}$$

$$x-3 = \pm 2$$

$$x-3 = 2 \quad \text{or} \quad x-3 = -2$$

$$+3 \quad +3 \qquad \qquad +3 \quad +3$$

$$x = 5 \quad \text{or} \quad x = 1$$

$$2x^2 - 8 = 0$$

$$= \quad +8 \quad +8$$

$$\frac{2x^2}{2} = \frac{8}{2}$$

$$x^2 = 4$$

$$x = \pm 2$$

$$(1) x^2 - 64 = 0$$

$$(2) \frac{1}{3}t^2 - 1 = 11$$

$$(3) -y^2 + 5 = -6$$

$$(4) (x+2)^2 = 9$$

$$(5) (d + \frac{1}{2})^2 = 1$$

$$(6) (x+4)^2 = 18$$
