Re: Inquiry about Core Logging Geologist Job Opportunity at Snow Lake, Manitoba

To whom it may concern,

Please consider my application for Core Logging Geologist at your zinc, gold & copper mine in Snow Lake Manitoba, as posted online. I am currently a 4th year student and I will graduate from the University of British Columbia by May 30th, 2019 with a Bachelor's of Science degree in Geology. I have a particular interest in working in mining because of the variety of economic mineral deposits that exist, and the opportunity to use geology to increase operation efficiency.

As you can see from my enclosed resume, I have been studying all types of economic mineral deposits. This knowledge combined with my field experience as a geologic field assistant for MSc. Student and former Cantung mine geologist, Ehsan Salmabadi during the summer of 2018, has given me an idea of the work expected from both a field and mine geologist, or Core Logging Geologist in this case.

As a geology student I have had the opportunity to study many types of mineral deposits, but VMS is one I would like to become even more familiar with. It is because of the deposits ore geometry tends to be heavily zoned that I find Volcanogenic Massive Sulfide deposits so interesting.

I have worked hard throughout my education and work experience opportunities obtaining a high grade point average of 3.70 and attending two geologic field schools and one summer of experience mapping in the Northwest Territories. These experiences in particular have prepared me for the responsibilities befitting a Core Logging Geologist. Furthermore I meet all of your qualifications except, GIT which I will be eligible to apply for after my graduation in May.

If my qualifications meet the need for the position, do not hesitate to contact me.

Sincerely,

Kai Corley-Jory
