

The Mermaid

A beautiful creature lurks in the depths of the water, you may find her in any body of water but she normally occurs in the sea, this creature is known as the mermaid. If you are lucky enough to find her you may see her playing with her many friends or rummaging shipwrecks for trinkets and apparel. Mermaids have a fascination to anything that shines or sparkles, jewels and gold become their most prized possessions. Never try to take any of these possessions from your mermaid, because I warn you she will make sure you suffer the consequences. As beautiful as these creatures are they are also very harmful, they are mischievous and many like to turn into sirens. These certain mermaids have the talent of singing and luring fishermen to them with their song. The mermaid sings and as soon as the fisherman can no longer control himself and gives into her song the mermaid will then drag the fisherman and his boat to the bottom of the ocean. Clever these creatures are, they pray on the fishermen to scavenge their ships and boats for any items they find intriguing and to add to their collections of trinkets and jewels.

The mermaid has a tale of a fish and an upper body of a woman, her skin glistens when she sits above the water as if her skin were always wet. Her hair flows long and grows in many different colours, normally adorned with shells, pearls or the numerous jewels they scavenge. The tale is the most magnificent part of the mermaid, the scales sparkle when she twists and turns in the water reflecting off the sun.

The mermaid is one of the most beautiful creatures mankind has found, but many question if they are actually real. Like mentioned earlier mermaids are mischievous creatures who don't want to be bothered over, they like to keep to themselves and indulge in their simple pleasures. Mermaids tend to live on their own or keep to small pods, therefore making it difficult to find the already small population of mermaids. If one is brave enough to seek out the mermaid one would find them on rocky coasts, such as those in England and Canada but, the mermaid is not specific to one place they could be lurking in any body of water all over the world.
