## ARCHITECTS

### What is a Living Breathing Building?

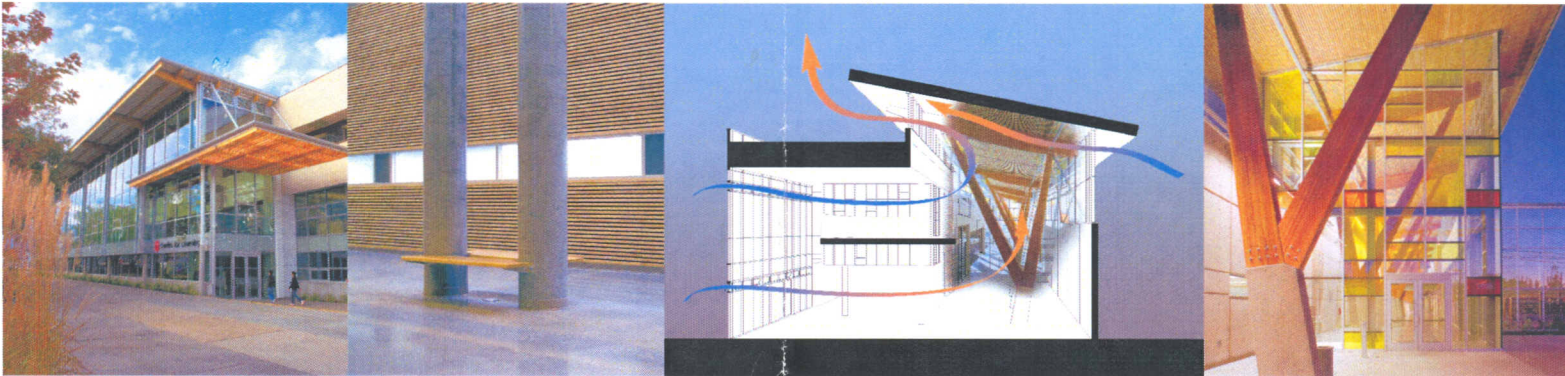

#### It embraces the sun . . .

Our daylighting strategies increase the amount of natural light and views to the outdoors to create healthy, livable spaces and reduce the energy used for lighting these spaces.

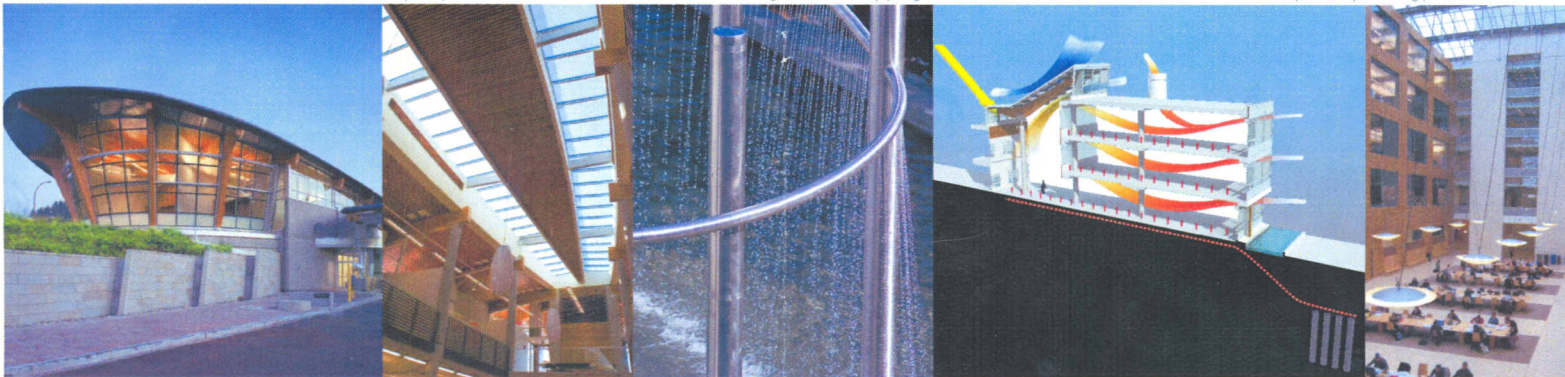

#### . . . embraces the wind . . .

We use natural ventilation to help cool the building and bring fresh air into every space, improving indoor air quality and thermal comfort for a healthy, toxin-free environment.

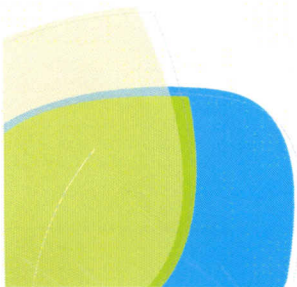

#### . . . embraces the earth . . .

We use natural, renewable and reused/recycled materials in each of our buildings. While tapping the earth as a natural source of heat helps keep energy use low.

#### . . . and embraces the water

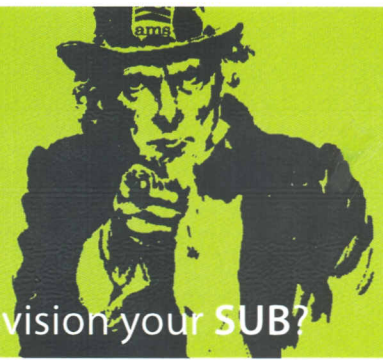

Our buildings implement green roofs, retention ponds and other landscape strategies to collect rain water for re-use and re-circulation in order to reduce water consumption.
